Setting up your optimization problem

Numerical approximation of gradients

Checking your derivative computation

I $f(\theta) = \theta^3$
 $\theta \in \mathbb{R}.$

$$g(\theta) = \frac{d}{d\theta} f(\theta) = f'(\theta)$$

$\frac{dw}{db}$ $\rightarrow \underline{g(\theta) = 3\theta^2}.$

$$g(\theta) = 3 \cdot (1)^2 = 3 \text{ when } \theta = 1$$

$$\frac{f(\theta + \epsilon) - f(\theta)}{\epsilon} \approx g(\theta)$$

$$\frac{(1.01)^3 - 1^3}{0.01} = 3.0301 \approx 3$$

$$\theta = 1$$

$$\theta + \epsilon = 1.01$$

$$\begin{array}{r} 0.0301 \\ 3.1 \\ \hline 3.2 \end{array}$$

Checking your derivative computation

$$\underline{f(\theta) = \theta^3}$$

$$\left[\frac{f(\theta + \epsilon) - f(\theta - \epsilon)}{2\epsilon} \approx \underline{g(\theta)} \right]$$

$$\frac{(1.01)^3 - (0.99)^3}{2(0.01)} = 3.0001 \approx 3$$

$$g(\theta) = 3\theta^2 = 3$$

approx error: 0.0001

(prev slide: 3.0301. error: 0.03)

$$\left\{ \begin{array}{l} f'(\theta) = \lim_{\epsilon \rightarrow 0} \frac{f(\theta + \epsilon) - f(\theta - \epsilon)}{2\epsilon} \\ \quad \quad \quad \uparrow \quad \quad \quad \uparrow \\ \quad \quad \quad 0.01 \quad \quad \quad 0.0001 \end{array} \right. \quad \left| \quad \begin{array}{l} \frac{f(\theta + \epsilon) - f(\theta)}{\epsilon} \quad \text{error: } O(\epsilon) \\ \quad \quad \quad \uparrow \quad \quad \quad \uparrow \\ \quad \quad \quad 0.01 \quad \quad \quad 0.01 \end{array} \right.$$
